Go karting in India is maturing, tracks are looking for a more modern and functional operation to improve safety and the overall appeal of their facilities, in their efforts to meet the expectations of today's demanding clientele.

KnK Karts along with their design partners Visions, Concepts & Realities, have designed several new products, with some more in the development pipeline, under the KnK **'TRAJKART'** product line;

Alongside, the development of the new range of the Series '8' rental karts is completed. These karts offer go kart entertainment establishments a new range of modern karts, with even more reliability that has become expected from KnK Karts. A higher level of safety features takes the new KnK Colt SX8, the KnK Genesis S8, KnK Genesis SX8 and KnK Genesis TS8 to the highest Go Karting safety standards in the world of Commercial Go Karting.

The SX8 series have been tested and meets the very stringent safety requirements in Israel, where they are now exported.

More information on the new range of the Series '8' Karts will soon be available on the KnK website.

'TRAJKART' PRODUCT LINE.

KnK Tyre Mate – the *'no skin off your knuckles'* assistant that makes removal and fitting of go kart tyres a breeze.

A "must-have" handy tool for every Go-kart track consists of a tool stand also, for handy storage.

KnK Barrier-cuda – a linkable barrier system that tidies up your track, and replaces tyre barriers that are unsightly.

There are lots of advantages with using the Barrier-Cuda trackside barrier system – made from UV stabilized, splinter-proof impact resisting, flexible moulded plastic. It offers safe displacement and prevents “bounce-back” of a kart into the path of other karts, the impact resistance can be adjusted by increasing or decreasing the ballast in each individual barrier. Hard, low friction deflector plates are available as optional extras to fit to barriers at accidents prone sections of the track, to improve safety and strength. Barrier inter-linking permits lengths of barrier chains to be adjusted to suit the track and conditions. It is completely sealed and does not retain water, so mosquitos don’t have a place to breed in it. It lends an appealing colourful and neat look to the track, different colour barriers are available on special request. The flat sides provide an attractive place to display advertisements of sponsors.

‘Modernize your track in a quick and dramatic way !!’

KnK-KARTRAK 'The Kart storage system'. Some reasons for you to consider it.

Storing go karts has always been a tedious and time consuming job, especially at all modern karting facilities, which cater to the demands of their clients by offering different types of karts specific to applications, thus increasing the enjoyment value for them.

Professionally run karting facilities cycle the karts and have spare karts, which are serviced and kept ready for use for the next decided period. Sorting and storage of this is a real problem, Kartrak makes this easy and practically flaw proof.

Floor space is at a premium today and Kartrak permits storing up to 5 karts in the space occupied by one.

Garage floors where the karts are stored normally have contaminants like oil, petrol and lubes on them, these hydrocarbons are harmful to tyres and leads to premature tyre wear as well as posing safety issues from reduced traction through absorbing them. Kartrak keeps the karts off the ground.

The Kartrak Kart Stacker makes loading the karts into their respective bays an efficiently executable operation. It is powered by an electric motor, which lowers and raises the karts to ease storage.

Talk soon.
